1. *Chlorophyll a* (Chl a) is the primary photosynthetic pigment in most plants and algae. It is a green pigment that absorbs light energy in the blue and red regions of the visible spectrum. Chl a is essential for the light-dependent reactions of photosynthesis, where it converts light energy into chemical energy in the form of ATP and NADPH.

(6.2.3) $\mathcal{L}(\mathcal{A}) = \mathcal{L}(\mathcal{B})$ if and only if $\mathcal{A} \equiv \mathcal{B}$.
